

Steel shaping the future

Steel is shaping the future. From the buildings in which we live and work to the ground-breaking innovations in engineering and science. Steel is all around us.

The reason for steel's omnipresence lies in the unique qualities of the material. Quite simply, steel meets many of the future challenges facing industry and society.

It is strong but also lightweight ; flexible but tough ; safe and extremely cost effective. Steel is also environmentally friendly, energy efficient and 100% recyclable. These properties enable steel to provide solutions which could not be achieved by any other material.

The majority of today's steels – thousands of different grades – have been created in the past ten years and are the result of constant investment and research by the industry.

In this brochure we illustrate just some of the achievements of steel and demonstrate how steel solutions are delivering sustainability and increased quality of life for the future.
